

Health, Safety and Security Workshop

2nd Symposium on Ammonia Energy, Université d'Orléans, France, 11-13 July 2023

Simon Gant

Fluid Dynamics Team, Risk and Human Factors Group, HSE Science and Research Centre

Research - HSE funded to provide evidence which underpins its policy and regulatory activities

Guidance - freely available to help people comply with health and safety law

Workshop Objectives

- Learn about recent scientific developments
- Share information about new projects and initiatives
- Raise safety-related issues that need to be addressed
- Ask questions and participate in discussions

- Broad scope:
 - Health, safety and security in ammonia production, transport and use

Outline of this talk

- Review discussions at last year's health and safety workshop
- Provide an update on recent activities at HSE
- Discuss useful recent publications and ongoing research projects

Outline of this talk

- Review discussions at last year's health and safety workshop
- Provide an update on recent activities at HSE
- Discuss useful recent publications and ongoing research projects

- Think about a question you would like to put to the room
 - HSE question: where do you seek information on ammonia safety, e.g., when designing a new facility or undertaking a new operation?

Review of Health and Safety Workshop, 3 Sept 2022

- Ammonia has been produced, stored, transported and used generally safely for many years by the fertilizer industry
- In the coming years, to meet Net Zero ambitions, we are likely to see new entrants who may be unfamiliar with the risks
- Novel risks may also emerge due to the use of ammonia in new environments and/or for new applications
- Important that research is undertaken to ensure that these novel risks are identified and appropriately managed
- Discussions focused on four areas:
 - Production, storage, distribution and use of ammonia

Review of Health and Safety Workshop, 3 Sept 2022

- Production
 - Siting of new ammonia facilities near sources of renewable energy
 - Decentralised production?
 - Need for inherently safe designs

- Storage
 - Cryogenic liquid ammonia: lack of experimental data on behaviour of spills
 - Hazard profiles depend on liquid ammonia storage conditions
 - Temperature-liquefied ($<-33^{\circ}\text{C}$, <5 bar)  Smaller hazard?
 - Pressure-liquefied (20°C , >8 bar)

Review of Health and Safety Workshop, 3 Sept 2022

Pressure-liquefied (Houston, Texas, 1976)

<https://www.houstonchronicle.com/news/houston-texas/houston/article/In-1976-an-ammonia-truck-disaster-claimed-the-12906732.php>

Figure 26 Photography of the Southwest freeway in Houston, Texas taken about one minute after the Houston tanker crash. Photograph taken by Texas Air Control Board (© Texas Commission Environmental Quality copyright 1976).

Temperature-liquefied (Blair, Nebraska, 1970)

Figure 25 Photos of the ammonia cloud resulting from the release at Blair, Nebraska. (a) Aerial view showing ammonia cloud covering whole of foreground; and (b) ground level view showing relatively shallow cloud depth, (c) Aerial view (© Washington County Enterprise copyright 1970)

From Batt (2021) "Review of dense-gas dispersion for industrial regulation and emergency preparedness and response" <https://admlc.com/publications/>

Review of Health and Safety Workshop, 3 Sept 2022

- Production
 - Are incidents more common for pressure-liquefied ammonia because of the frequency of operations, e.g., agricultural fertilizer applications in the USA?
 - Often the source of the leak is failure of a transfer connection or hose

© Beach Park Fire Department
<https://www.chicagotribune.com/suburbs/lake-county-news-sun/ct-lns-cdc-report-ammonia-fog-zion-st-0131-20200130-bphoo3jltjffxnsed2u3ftbqqq-story.html>

 Source: Hazardous Materials Investigation Report: HZIR-22/01
www.nts.gov/investigations/AccidentReports/Reports/HZIR2201.pdf

Review of Health and Safety Workshop, 3 Sept 2022

- Production
 - Important considerations: level of training of operatives involved in filling operations
 - Need for new system designs that completely reduce chances of leaks
 - Standards and guidance: good examples from LPG and industrial gas sector
 - Ammonia guidance often internal fertilizer company documents
 - Useful for this guidance to be shared with new entrants to the ammonia market
 - Efforts to be coordinated by the Energy Institute? The Ammonia Energy Association? AIChE? ASTI?
 - For other toxic chemicals, such as chlorine, there are established groups that help to share safety-related information, e.g., the Chlorine Institute

Review of Health and Safety Workshop, 3 Sept 2022

- Distribution and Utilization
 - Ammonia is an important future clean transportation fuel, mainly in shipping
 - Risk assessments followed by demonstration projects are needed
 - Experience of ammonia in liquefied-gas carriers: useful source of guidance and statutory requirements
 - Toxicity challenges are significant but manageable, adding complexity to ship designs
 - Ammonia likely to be used for deep-sea cargo vessels, rather than passenger or inland-waterway craft
 - Bunkering operations? Still some challenges and unknowns
 - Ship designs: how to reduce risks to crew in case of a leak?
 - Design and layout needs high level of inherent safety: consideration of double-containment, gas detection etc.

Review of Health and Safety Workshop, 3 Sept 2022

- Distribution and Utilization
 - Handling ammonia onboard ships will require new set of skills and safety procedures
 - Need for new regulations, codes and rules development
 - Technical issues to be solved in use of ammonia in combustion engines:
 - Use of pilot fuels
 - Co-firing with hydrogen for improved combustion
 - Corrosion of engine components (seals, bearings etc.)
 - Reactions between ammonia and lubricants producing toxic products
 - Public perception of ammonia risks and benefits of switching from fuel oil

Outline of this talk

- Review discussions at last year's health and safety workshop
- Provide an update on recent activities at HSE
- Discuss useful recent publications and ongoing research projects

Recent activities at HSE

- Jack Rabbit III <https://www.uvu.edu/es/jack-rabbit/>
 - Completed (mostly) the model-intercomparison exercise on previous pressure-liquefied ammonia release experiments: Desert Tortoise and FLADIS
 - Three groups still running dispersion models for the exercise:
 - Dave Brown (Argonne National Lab) CASRAM model, also used for developing the PHMSA Emergency Response Guidebook dispersion distances
 - Bob Bradley (Emergency Management Solutions) ALOHA
 - Bjørn Lilleberg (DNV KFX) testing ammonia-specific version of KFX
 - Aiming to write-up full account in September-November 2023 for journal publication

Abstract

The Red Squirrel ammonia field experiments were conducted at the DNV Spadeadam site in the UK in 2022. Field test data currently exists for high-pressure (ambient temperature) two-phase releases of ammonia from Desert Tortoise (1983) and FLADIS (1996) experiments. No field tests have ever been done for cold (refrigerated) ammonia liquid spills on dry land or into water. The handling of liquified ammonia, during storage/processing and transportation, in a cold (refrigerated) state is inherently safer than in a high-pressure (ambient temperature) liquified state. The main objective of the Air Products' Red Squirrel Tests was to determine the source term and dispersion characteristics for high-pressure (ambient temperature) liquified ammonia and low-pressure (cold/refrigerated) liquified ammonia in form of two-phase releases and liquid spills, respectively. Liquid spills on concrete and water were studied, along with the process conditions that led to the transition from liquid spills to two-phase flow regimes based on discharge pressures for cold liquified ammonia. Details on the equipment, instrumentation, secondary containment, and ammonia sensors and their layout are presented. An initial analysis of the source terms and dispersion behavior for two-phase releases and contained liquid spills over a range of weather conditions is also provided.

Cryogenic Storage of Anhydrous Ammonia

Adrian Wright, Technical Lead Process Safety, TGE Gas Engineering GmbH

Suite 2a, Manchester International Office Centre, Styal Road, M22 5WB Manchester

As well as providing bulk cryogenic storage for LNG and LPG, TGE-Gas is getting an increased number of projects, and project enquiries for large scale cryogenic bulk storage of anhydrous ammonia. Ammonia has long been used in the fertiliser industry, but it now has the potential to be a clean feed for production of hydrogen gas fuelling aviation. This will lead to an increase in the need for cryogenic anhydrous ammonia bulk storage tanks at new locations such as airports.

Hazards 32 delegates will benefit by understanding the properties of anhydrous ammonia that make it very suitable for cryogenic bulk storage at atmospheric pressure and will gain an understanding of how the hazards from liquid ammonia can be successfully managed during commissioning and operation.

Industry partners

- [Yara International](#)
- [Amon Maritime](#)
- [ECONNECT Energy](#)
- [Ocean Hyway Cluster](#)
- [HYEX Safety](#)
- [Viridis Bulk Carriers](#)

MaritimeNH3 focuses on developing improved models for safety assessments, methodologies for techno-economic analysis and GHG assessments of the whole NH₃ value chain, and technological advancements for end-use in NH₃-fuelled engines and fuel cells. It will address barriers related to the use of NH₃ as a maritime fuel including production, cost, safety, regulations, end-use technology and understanding of the value chain.

 **Project duration**
2021 - 2024

Aims and objectives

MaritimeNH3's main objective is to develop and disseminate knowledge contributing to the necessary technology advancements in the ammonia (NH₃) value chain in order to enable a safe and cost-efficient implementation of NH₃ as a maritime fuel.

This will be achieved by:

- Improving risk mitigation for NH₃ bunkering installations in a Nordic climate by improving the modelling of NH₃ dispersion at ppm levels between rapidly lethal and detectable odour limits,
- Advancing the technological development of NH₃-fuelled combustion engines and high-temperature fuel cells by evaluating concepts for improving the combustion characteristics of NH₃ and determining the main degradation mechanisms that impact the lifetime of NH₃-fed fuel cells,
- Developing and applying a methodology for a techno-economic analysis and greenhouse gas (GHG) assessment of a Norwegian NH₃-based energy system for maritime transport, and comparing this to alternative H₂-based value chains, and
- Increasing the social acceptance of NH₃ as a maritime fuel, and promoting its uptake and further development.

<https://www.sintef.no/en/projects/2021/maritimenh3-enabling-implementation-of-ammonia-as-a-maritime-fuel/aims-and-objectives>

Ongoing Research Projects

- Project **SafeAm** led by Marta Bucelli, SINTEF
- Small-scale experiments involving ammonia spills on water
- Model development and testing
- Awarded funding by the Research Council of Norway, June 2023

HSE question

- Where do you seek information on ammonia safety, e.g., when designing a new facility or undertaking a new operation?
 - Lloyds Register, DNV and NTU reports cited earlier

Safety-Related Information

■ PHMSA Emergency Response Guidebook (ERG) for hazard distances

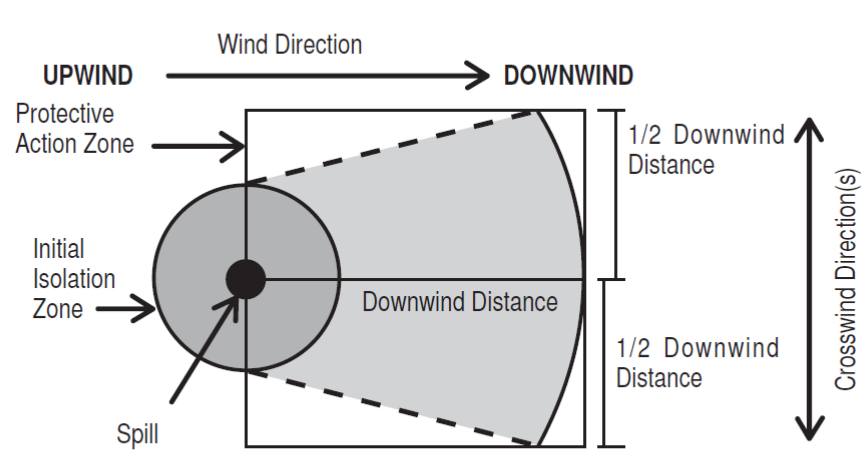

<https://www.phmsa.dot.gov/training/hazmat/erg/emergency-response-guidebook-erg>
<https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2021-01/ERG2020-WEB.pdf>

steps you take to preserve the health and safety of emergency responders and the public. People in this area should be evacuated and/or sheltered-in-place. Consult pages 289-291.

(6) Initiate protective actions beginning with those closest to the spill site and working away in a downwind direction. When a water-reactive TIH (PIH in the US) producing material is spilled into a river or stream, the source of the toxic gas may move with the current or stretch from the spill point downstream for a large distance.

In the figure below, the spill is located at the center of the small black circle. The larger circle represents the initial isolation zone around the spill. The square (the protective action zone) is the area in which you should take protective actions.

Note 1: For factors that may change the protective action distances, see "Introduction to Green Tables" (page 286).

Note 2: When a product in Table 1 has the mention (when spilled in water), you can refer to Table 2 for the list of gases produced when these materials are spilled in water. The TIH gases indicated in Table 2 are for information purposes only.

For more information on the material, safety precautions and mitigation procedures, call the emergency response telephone number listed on the shipping paper or the appropriate response agency as soon as possible.
